

ABSTRACT

A color selection assembly includes a color selection electrode and a frame for supporting the color selection electrode. The frame applies a tension to the color selection electrode in the direction of V-axis. The color selection electrode includes a perforated area having a plurality of openings for the passage of electron beams and non-perforated areas formed on both sides of the perforated area in the direction of H-axis. The non-perforated area has a center portion and end portions disposed on both sides of the center portion in the direction of V-axis. The center portion has a width wider than the widths of the end portions.
